Bridge : Ready-made Functions

Inside the demo folder you will find many examples of how to construct queries. The number of queries you can construct are virtually limitless so there is no way to prepare every single query every one might ever want or need but there are a few examples that we felt might be popular.

These functions were removed from the demo scripts and placed inside of WUPostal directly as static public functions you can use right out of the box. These functions are:

- FetchPageById(int id)
- FetchPageBySlug(string slug)
- FetchLastBlogPosts(int category, int count = 5)
- FetchLastBlogPostsForUser(int user, int category, int count = 5)
- FindPostsMadeOn(int year, EWUPDateMonths month, EWUPDateDays day)
- FindPostsMadeThisWeek()
- FindPostsMadeAfter(int year, EWUPDateMonths month, EWUPDateDays day)

- FindPostsMadeBetween(int year, EWUPDateMonths month, EWUPDateDays day, int to_year, EWUPDateMonths to_month, EWUPDateDays to_day, bool inclusive =true)
